

Day 2 Practice: Python Assignment and GITHUB file commit:

Grade system :

```
python: can't open file 'C:\\Users\\Johithpranav\\mkmdir': [Errno 2] No such file or directory
C:\\Users\\Johithpranav>mkdir grade-system
C:\\Users\\Johithpranav>cd grade-system
C:\\Users\\Johithpranav\\grade-system>cd ..
C:\\Users\\Johithpranav>cd F:\\AI\\GenAI_SocialEagle
C:\\Users\\Johithpranav>F:
F:\\AI\\GenAI_SocialEagle>mkdir grade-system
F:\\AI\\GenAI_SocialEagle>cd grade-system
F:\\AI\\GenAI_SocialEagle\\grade-system>python -m venv venv
F:\\AI\\GenAI_SocialEagle\\grade-system>venv\\Scripts\\activate.bat
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system>notepad grade_system.py
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system>cd venv
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system\\venv>python grade_system.py
Enter your mark (0-100): 50
Entered mark: 50.0 | Grade: E
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system\\venv>90
'90' is not recognized as an internal or external command,
operable program or batch file.
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system\\venv>python grade_system.py
Enter your mark (0-100): 90
Entered mark: 90.0 | Grade: A
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system\\venv>python grade_system.py
Enter your mark (0-100): g
Invalid input. Please enter a number.
(venv) F:\\AI\\GenAI_SocialEagle\\grade-system\\venv>
```

GITHUB Repo Link :

https://github.com/boopathikumar-ui/Python_programs

The screenshot shows a GitHub repository page for 'boopathikumar-ui / Python_programs'. The file 'grade_system.py' is selected, and its code is displayed. The code is a Python script that takes a mark as input and returns a grade based on the following logic:

- If mark < 0 or mark > 100: print("Invalid mark. Please enter a mark between 0 and 100.")
- elif mark >= 90: grade = "A"
- elif mark >= 80: grade = "B"
- elif mark >= 70: grade = "C"
- elif mark >= 60: grade = "D"
- else: grade = "E"

The code also includes error handling for invalid input (non-numeric values) and prints the entered mark and the corresponding grade.

More about python from Social Eagle to AI (hug)

From: 24th Aug 2026

- Python has many inbuilt functions
- Print ("my first program")
- Python extension: .py (or) .ipynb (for Jupyter Notebook)
- IDE's → vs code, cursor, Anigravity
- Syntax → Rule for writing code
- Comments with #
- Indentation is must in python.
- Python is case sensitive.
- Variable example: Ex: name = 23
- Name is different from name variable.

* Python Virtual environment

- A Virtual environment is a separate, private space for each python project
- It keeps the libraries (extra tools) of one project away from another project.

Steps:

one main folder = one virtual environment.

- Step 1: create virtual environment
- Step 2: Activate virtual environment, use `changelog` for comments, syntax.

- .py file creation.
- requirements file creation, (contains needed packages)

Operators in Python:

Special symbols used to perform operations on values. ^{Arithmetic} Ex: +, -, *, /, %(modulus - remainder)

1) Floor division, ** (Power):

Comparison operators:

= Equal to
!= Not equal to
> Greater than
< Less than
≤ Less than or equal to
≥ Greater than or equal to

* Logical operators:

and - Both are true
or - True if any one is true
not - Reverses the result.

* Assignment operators:

= and +=, -= = Assigns values to variables

Score += 5 # same as Score = Score + 5

or
Score -= 2 # Score = Score - 2

Data Types:

Datatype tells what type of value it holds.

int
float
str
bool. (True/False) (INT caps)

* Type conversion can be done.

Python - List, Sets, Tuples, Dictionary

also called: Collections: characteristics

	Type	Symbol	Ordered?	Changeable?	Duplicates?
Containers	List	[]	yes	yes	yes
	Tuple	()	yes	NO	yes
	Set	{ }	NO	yes	NO
	Dictionary	{key: value}	yes	yes	NO (key)

1. LIST:

stores multiple items.

Ex: fruits = ["apple", "banana", "mango"]

print(fruits) → Index.

print(fruits[0]) # accessing from 0

print(fruits.append("orange")) # add new item

fruits[1] = "grape" # change an item

2. TUPLE:

same like list, but you cannot change values.

Ex: colors = ("red", "green", "blue")

print(colors[0]) # we can read

colors[0] = "yellow" # not possible to change

A set stores items with no duplicates & no order.

Ex: numbers = {1, 2, 2, 3, 3, 3}

print(numbers) # duplicates are removed.

numbers.add(4) # add a new item.

print(numbers)

Ex: {1, 2, 3}

or {1, 2, 3, 4}

Dictionary {key: value}

A dictionary stores data as key-value pairs.

student = {

"name": "ravi",

"age": 20,

"city": "Delhi",

}

print(student)

print(student["name"]) # get value using key.

student["age"] = 21 # change a value.

student["grade"] = "A" # add a new key-value pair.

Python control flow:

To make decision in program,

= if, elif, and else.

- Indentation is important.

Ex: if age > 18:

print("You are adult")

task. Write it that does a specific
def grow(x):
 print("...")
 if x == 1:
 add(1)
 elif x == 2:
 add(2)
 else:
 add(x)
 return
 return x

given is to return the value.

Modules: / paragraphs:

Collection of solved questions.

to call a function when resides in
module then module function.

Eq from modules addition: import add

Box handling:

- * Try → write the code that might cause an error
- + except → write what to do if an error happens

Ex.

try:
 result = 10%
 print C result)
 except:
 print C" error" Give 40 2 am"

2 Rad from pic:

with open C" of pro + 231°, in " as the:

Prater (concrete)

with open ("my file.txt", "a") as file:

```
file.write("\n this line added")
print("\n new added")
```

Q. Really fine by me:

with open('myfile.txt', 'r') as file

for one in five:

SNP demands extra

spans / new line.
